Visio files import and export Customized fonts and shapes Insert images and attachments File encryption and file backup Have you ever tried to create a floor plan in Excel before? Our Floor Plan Excel Template is the first available spreadsheet that can help you with that issue! You can create a floor layout plan with this template easily in a few seconds. Excel Floor Plan Template Main Features: The floor plan will be created automatically on the squared page which is separated from the drawing area. You don't have to make any manual adjustments on this part. According to the selections you made on the table, the shapes will appear automatically when you click the Draw button on the top. Let's have a look at each feature in detail. Current Position: This part shows the starting point coordinates of the cell you have selected inside the drawing area. If you select a range inside the squared area instead of one cell, you can see again the X, and Y units of the starting point in the current position box. The main point is to determine the coordinates of the starting point to create shapes, walls, items, etc. Scale: The one square cell dimension is already set previously in the floor plan template. However, if you want to change the scale of the page, you can manually readjust the one square size as width and height. There is a possibility that scaling will not be extremely accurate. You need to remember the smallest length is equal to the size of one square block. Let us use an example to explain it clearly. For example, you set the one square as 20 cm X 20 cm. So, if you would like to draw an element that has a smaller size (10 cm X 10 cm) than the one square size you have set before, the template will just be capable of drawing an element with the min size of one square. Because it recognizes the min size (20 cm X 20 cm) as you set on the square dimension table. Besides that, if you want to reset or change the dimension of one square, the template will update the drawing area with the new scale. Table (to set all drawing elements): Each element that you would like to place in the floor plan must be described in the table first. The first five-column is mandatory to be able to create the shapes. You have to fill in the Name, Dimensions (H as height, W as width), and Start Position columns. The X and Y coordinates for the start position column can be taken from the "current position" box. If you leave the color and line column empty, a regular black line will be used as a default. Besides that, in the line column of the style section, there is one option called "circle" that allows you to draw circles. There are six more line types to select such as regular, dash-dot, crossed... Setups for Floor Plan Excel Template: Additionally, you can save the floor plan you have already drawn by using the Save Preset button. The template allows you to save up to 60 plans. If you would like to create a new one without losing the plan you previously created, you should save it first. After that, you can turn it back on later when you want to work on it. Besides that, you can reload all the presets you saved previously and continue to work. All you need to do is find the name of the plan from the dropdown button and click the Load Preset button. Main buttons: There are 3 main buttons on the top of the floor plan template. Draw: Once you fill the table with the items you would like to place in the plan. Please click the draw button to see it immediately on the squared page. You can also redraw or change your existing elements or add new objects, items, etc. But, please do not forget to click the draw button again every time you made any changes. Clear: This button has two steps. The first is to clear just the drawing area and shapes. After that, you will see a pop-up asking you if you also want to remove all the elements from the table. So, you can keep continuing to work on the existing table to create another plan. Add / Remove Names: You can display or remove the name of the elements with this button. If you want to move the elements you have previously created to different positions, just click the cell that you want to move and overwrite the X, and Y coordinates in the table. Please do not forget to click the draw button to reflect the changes to the plan. The position of the shapes you would like to move stays unchanged until you click the button. We suggest following the instructions and product tutorial video until you totally figure out how you can use all the features. Additionally, you can hide the instructions with one button once you got familiar with the excel square cells, borders, and lines. Chart, and more Cloud architecture design tool: AWS, Azure, Google Cloud, IBM, Oracle, Alibaba, Tencent Powerful Flowchart, Floor plan, Mind map and Venn diagram tool Process Map Designer with templates like Customer Journey Mapping, Competitor Analysis, Root Cause, etc 1 Before sketching the floor plan, you need to do a site analysis, figure out the zoning restrictions, and understand the physical characteristics like the Sun, view, and wind direction, which will determine your design. 2 When inspecting the space, measure the walls, doors, windows, and existing furniture accurately. If you are creating the layout for an entirely new area, you can look for and survey the buildings in similar areas to use as an estimate in your floor plan. 3 Use EdrawMax Online to create a sketch of the layout, which is a simple representation of what you are going to achieve and how your space is divided. You can draw the basic floor plan on scale by using a template or building with pre-designed symbols. 4 Now it's time to add doors, windows, furniture, appliances, any other fixtures to complete your floor plan. Most of the symbols, shapes, and icons can be found in our floor plan symbol libraries. Besides, you can draw the symbols and upload them to your own library. 5 Save floor plans in your personal cloud with our 100% security guarantee. Share them with your team, friends or family, and get helpful advice and feedback. Architectural diagram of a structure For integrated circuit diagrams, see Floorplan (microelectronics). Dimensions are usually drawn between the walls to specify room sizes and wall lengths. Floor plans may also include details of fixtures like sinks, water heaters, furnaces, etc. Floor plans may include notes for construction to specify finishes, construction methods, or symbols for electrical items. It is also called a plan which is a measured plane typically projected at the floor height of 4 ft (1.2 m), as opposed to an elevation which is a measured plane projected from the side of a building, along its height, or a section or cross section where a building is cut along an axis to reveal the interior structure. Overview Similar to a map, the orientation of the view is downward from above, but unlike a conventional map, a plan is drawn at a particular vertical position (commonly at about four feet above the floor). Objects below this level are seen, objects at this level are shown 'cut' in plan-section, and objects above this vertical position within the structure are omitted or shown dashed. Plan view or planform is defined as a vertical orthographic projection of an object on a horizontal plane, like a map. The term may be used in general to describe any drawing showing the physical layout of objects. For example, it may denote the arrangement of the displayed objects at an exhibition, or the arrangement of exhibitor booths at a convention. Drawings are now reproduced using plotters and large format xerographic copiers. A reflected ceiling plan (RCP) shows a view of the room as if looking from above, through the ceiling, at a mirror installed one foot below the ceiling level, which shows the reflected image of the ceiling above. This convention maintains the same orientation of the floor and ceiling plans – looking down from above. RCPs are used by designers and architects to demonstrate lighting, visible mechanical features, and ceiling forms as part of the documents provided for construction. The art of constructing ground plans (ichnography; Gr. ἰχνογραφία, *ichnos*, "trace" and *γράφειν*, *gráphō*, "to write"[1] pronounced ik-nog-raf) was first described by Vitruvius (i.2) and included the geometrical projection or horizontal section representing the plan of any building, taken at such a level as to show the outer walls, with the doorways, windows, fireplaces, etc., and the correct thickness of the walls; the position of pillars, columns or pilasters, courtyards and other features which constitute the design,[2] as to scale. Floor plan topics Building blocks Floor plans use standard symbols to indicate features such as doors. This symbol shows the location of the door in a wall and which way the door opens. A floor plan is not a top view or birds eye view. It is a measured drawing to scale of the layout of a floor in a building. A top view or bird's eye view does not show an orthogonally projected plane cut at the typical four foot height above the floor level. A floor plan could show:[3] interior walls and hallways restrooms windows and doors appliances such as stoves, refrigerators, water heater etc. Interior features such as fireplaces, saunas and whirlpools the use of all rooms Plan view A plan view is an orthographic projection of a three-dimensional object from the position of a horizontal plane through the object. In other words, a plan is a section viewed from the top. In such views, the portion of the object above the plane (section) is omitted to reveal what lies beyond. In the case of a floor plan, the roof and upper portion of the walls may typically be omitted. Whenever an interior design project is being approached, a floor plan is the typical starting point for any further design considerations and decisions. Roof plans are orthographic projections, but they are not sections as their viewing plane is outside of the object. A plan is a common method of depicting the internal arrangement of a three-dimensional object in two dimensions. It is often used in technical drawing and is traditionally crosshatched. The style of crosshatching indicates the type of material the section passes through. 3D floor plans A 3D floor plan can be defined as a virtual model of a building floor plan. It is often used to better convey architectural plans to individuals not familiar with floor plans. Despite the purpose of floor plans originally being to depict 3D layouts in a 2D manner, technological expansion has made rendering 3D models much more cost effective. 3D plans show a better depth of image and are often complemented by 3D furniture in the room. This shows a greater appreciation of scale than with traditional 2D floor plans. Usually built to scale, a 3D floor plan must include walls and a floor and typically includes exterior wall fenestrations, windows, and doorways. It does not include a ceiling so as not to obstruct the view. Other common attributes may be added, but are not required, such as cabinets, flooring, bathroom fixtures, paint color, wall tile, and other interior finishes. Furniture may be added to assist in communicating proper home staging and interior design.[1] Purpose 3D floor plans assist real estate marketers and architects in explaining floor plans to clients. Their simplicity allows individuals unfamiliar with conventional floor plans to understand difficult architectural concepts. This allows architects and homeowners to literally see design elements prior to construction and alter design elements during the design phase. 3D floorplans are often commissioned by architects, builders, hotels, universities, real estate agents, and property owners to assist in relating their floor plans to clients.[2] Construction A 3D floor plan is built utilizing 3D rendering software, the same type of software used to create major animated motion pictures. Through complex lighting,[3] staging, camera, and rendering techniques 3D floor plans appear to be real photographs rather than digital representations of the buildings after which they are modeled. It is also the presentation of building floor-plan in an advanced manner, bringing it to real life views.[4] Technology WebGL allows many companies to provide their users with unique 3D experiences right in their web browser. In addition, since 2014, WebVR helps make Virtual Reality experiences accessible to wider audiences. 3D floor plans can now be visited via Google Cardboard or various VR headsets. Due to the increasing popularity of VR content, many real estate professionals (real estate firms, developers, online platforms) are turning to 3D models of spaces to improve their marketing efforts.[5] See also Floor plan Plan (drawing) 3d rendering Virtual tour Home staging Computer-aided design WebVR WebGL References ^ "A Virtual Look Into Don Draper's Mad Men Apartment". 2016-03-31.
